

The data-world of a tree

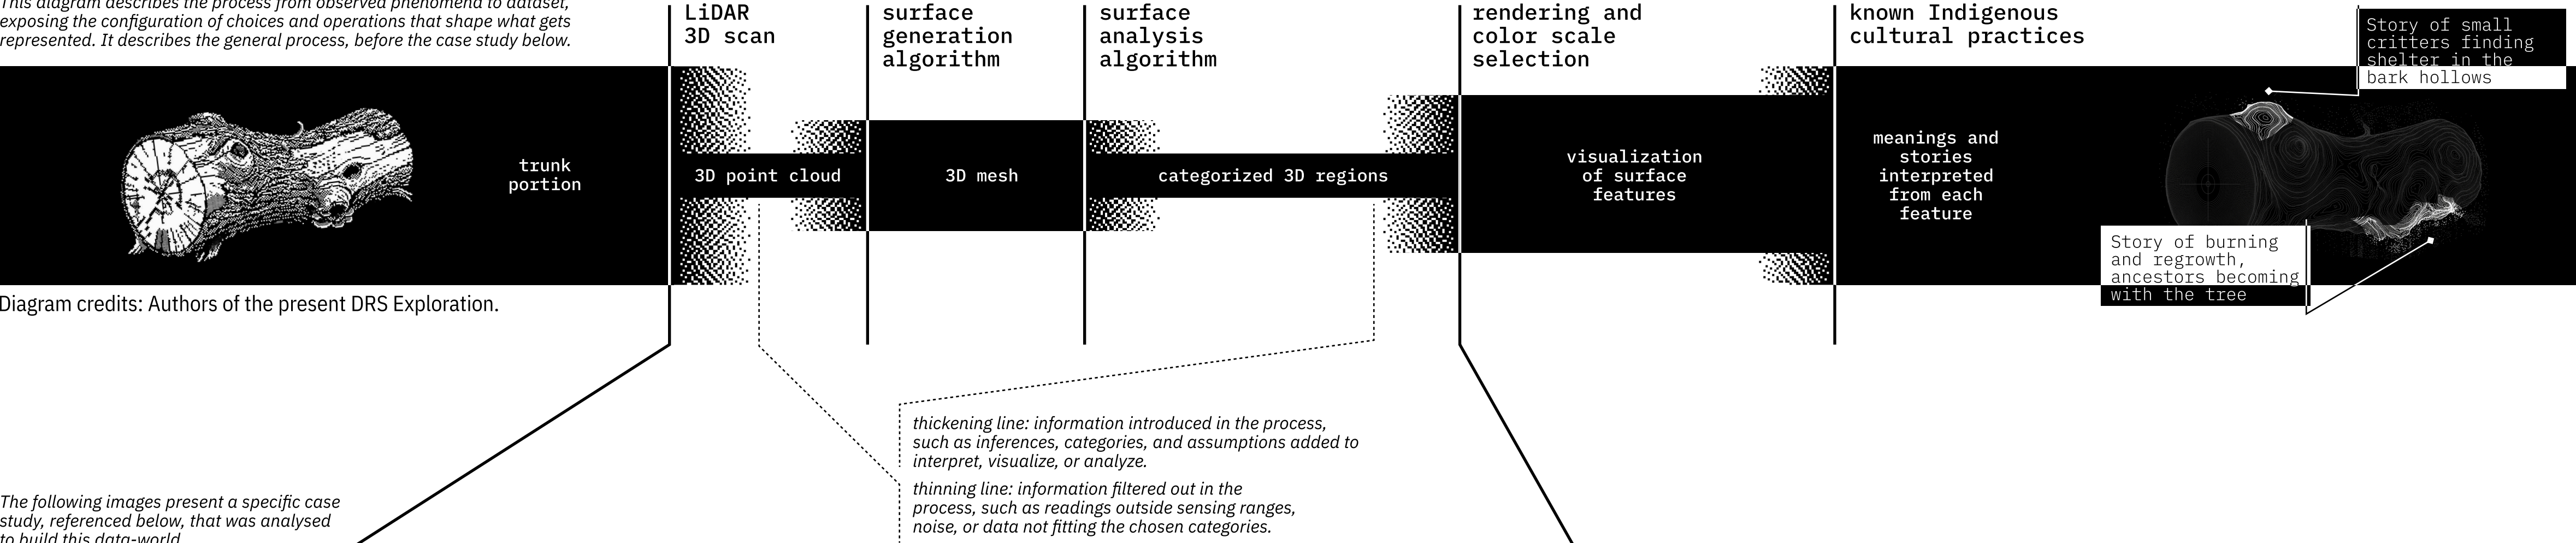

A walk through what the laser saw.

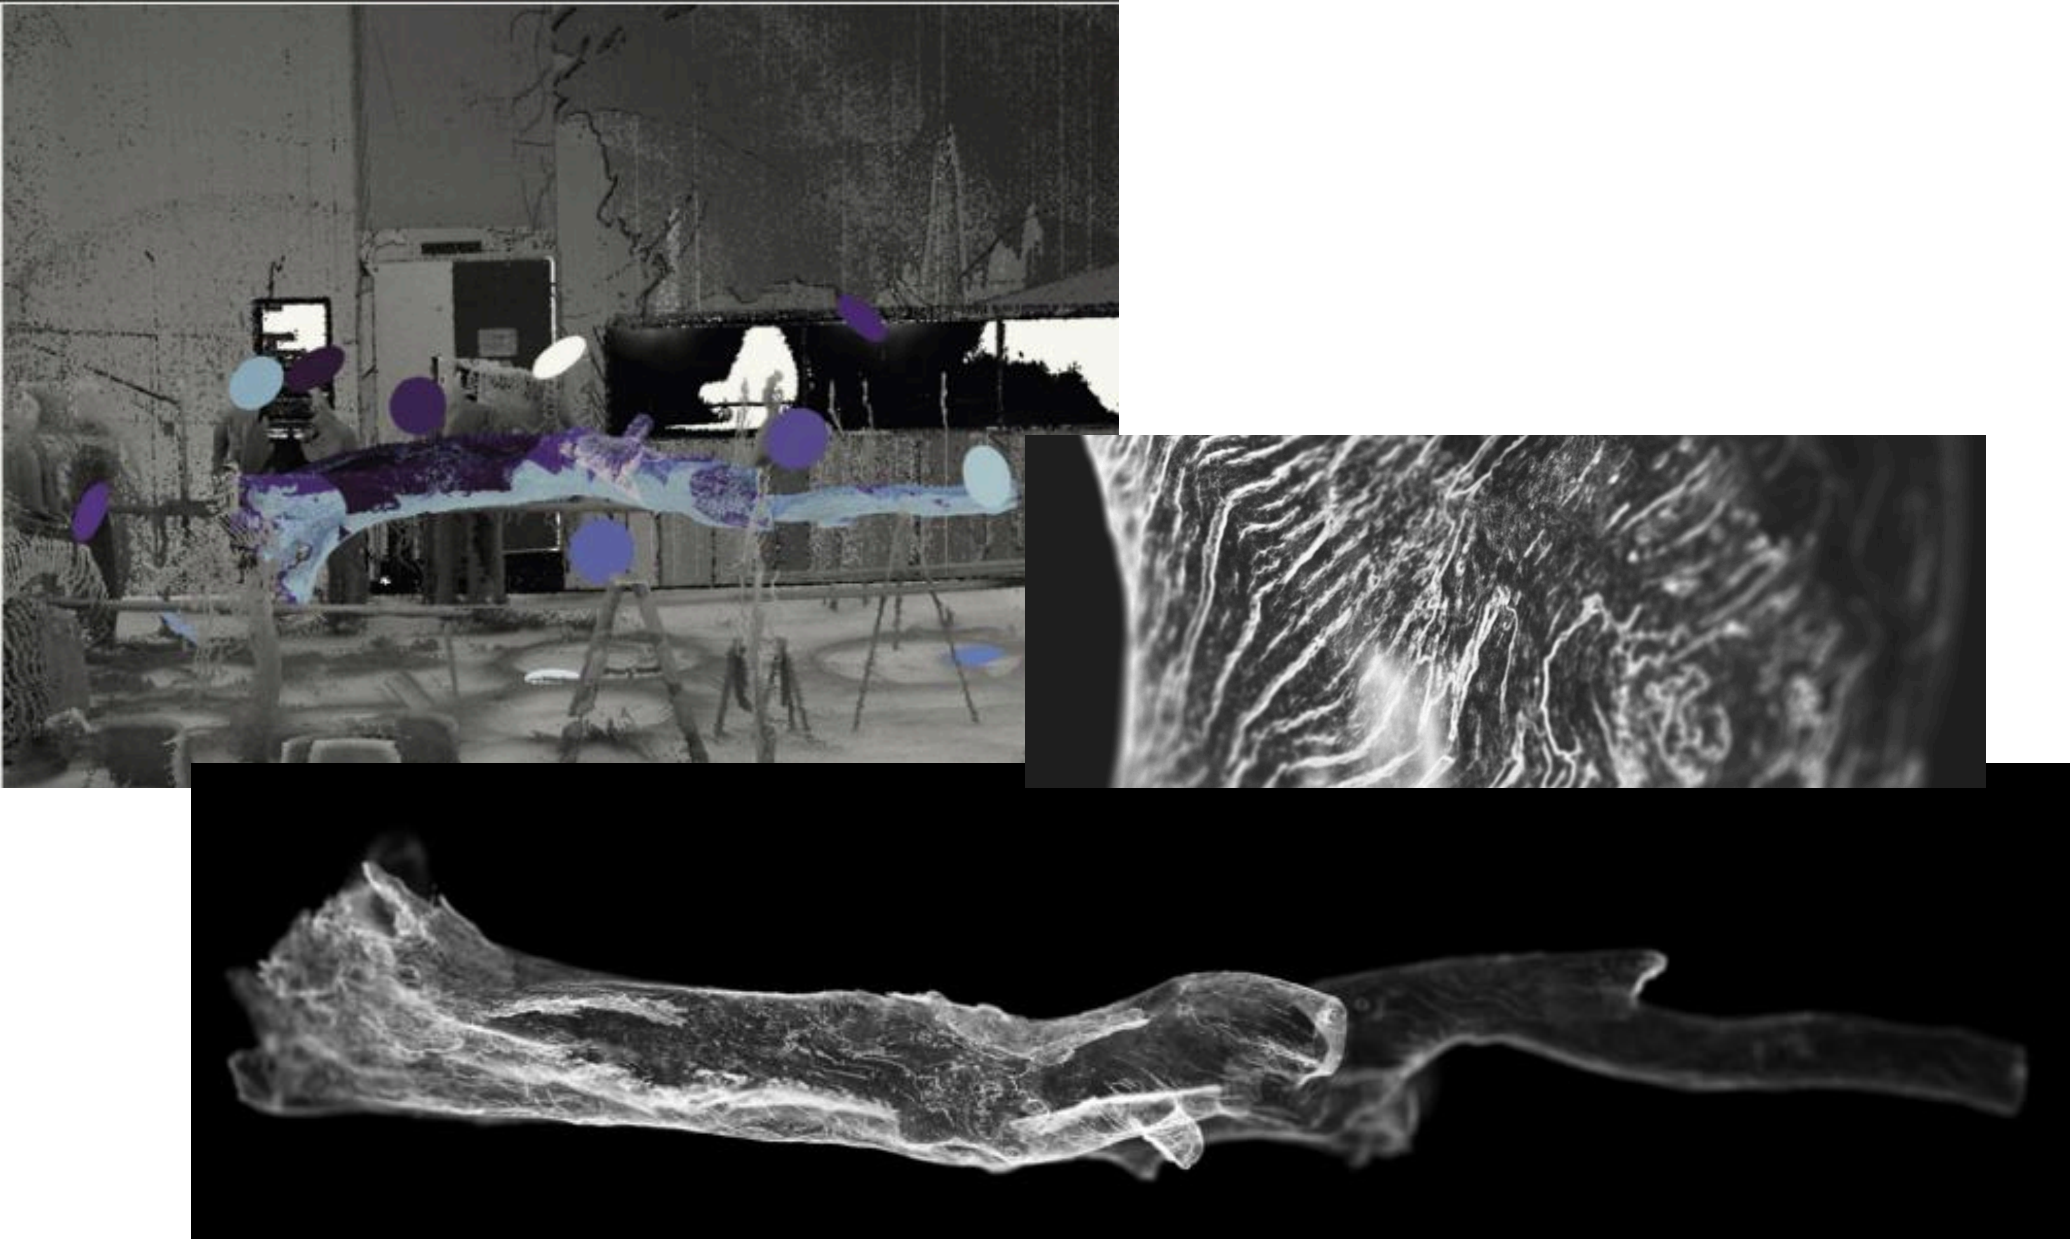

The data-world of a tree

From the tree to the dataset.

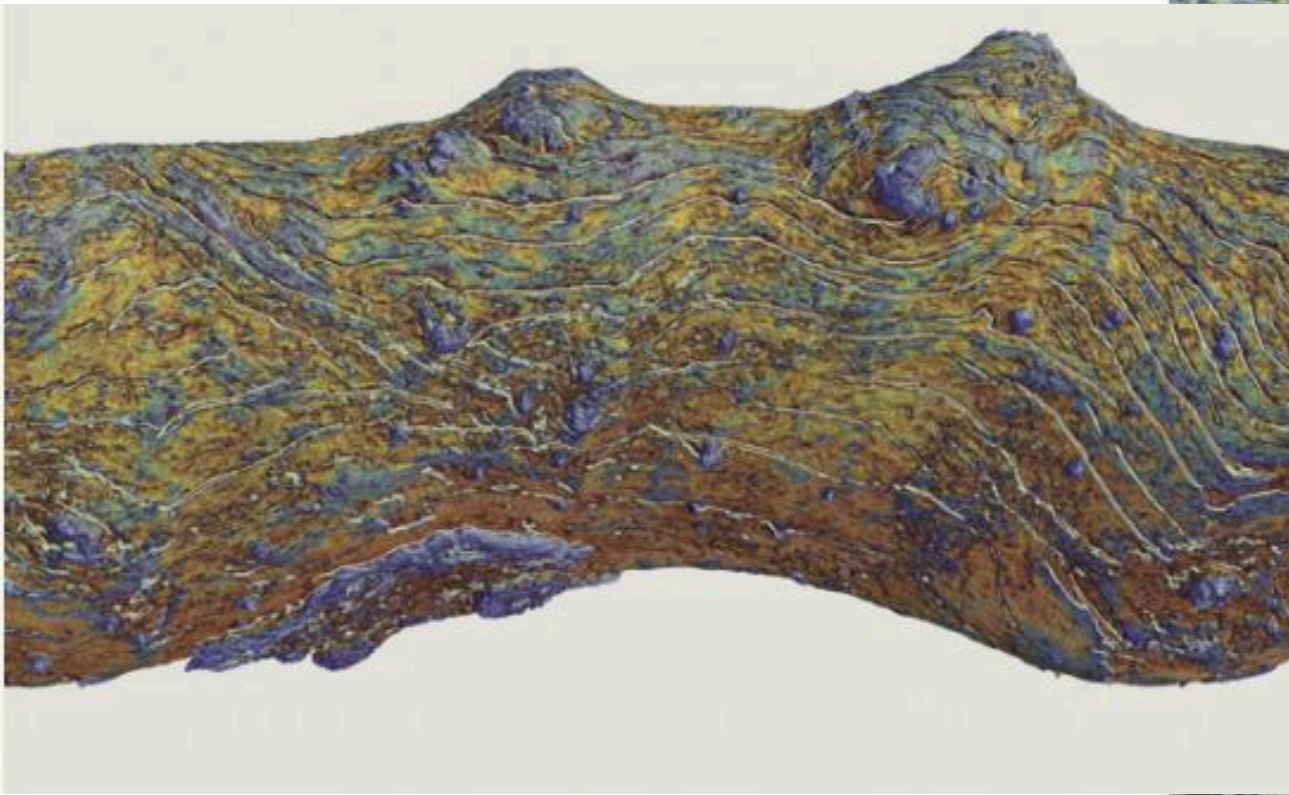

This diagram describes the process from observed phenomena to dataset, exposing the configuration of choices and operations that shape what gets represented. It describes the general process, before the case study below.

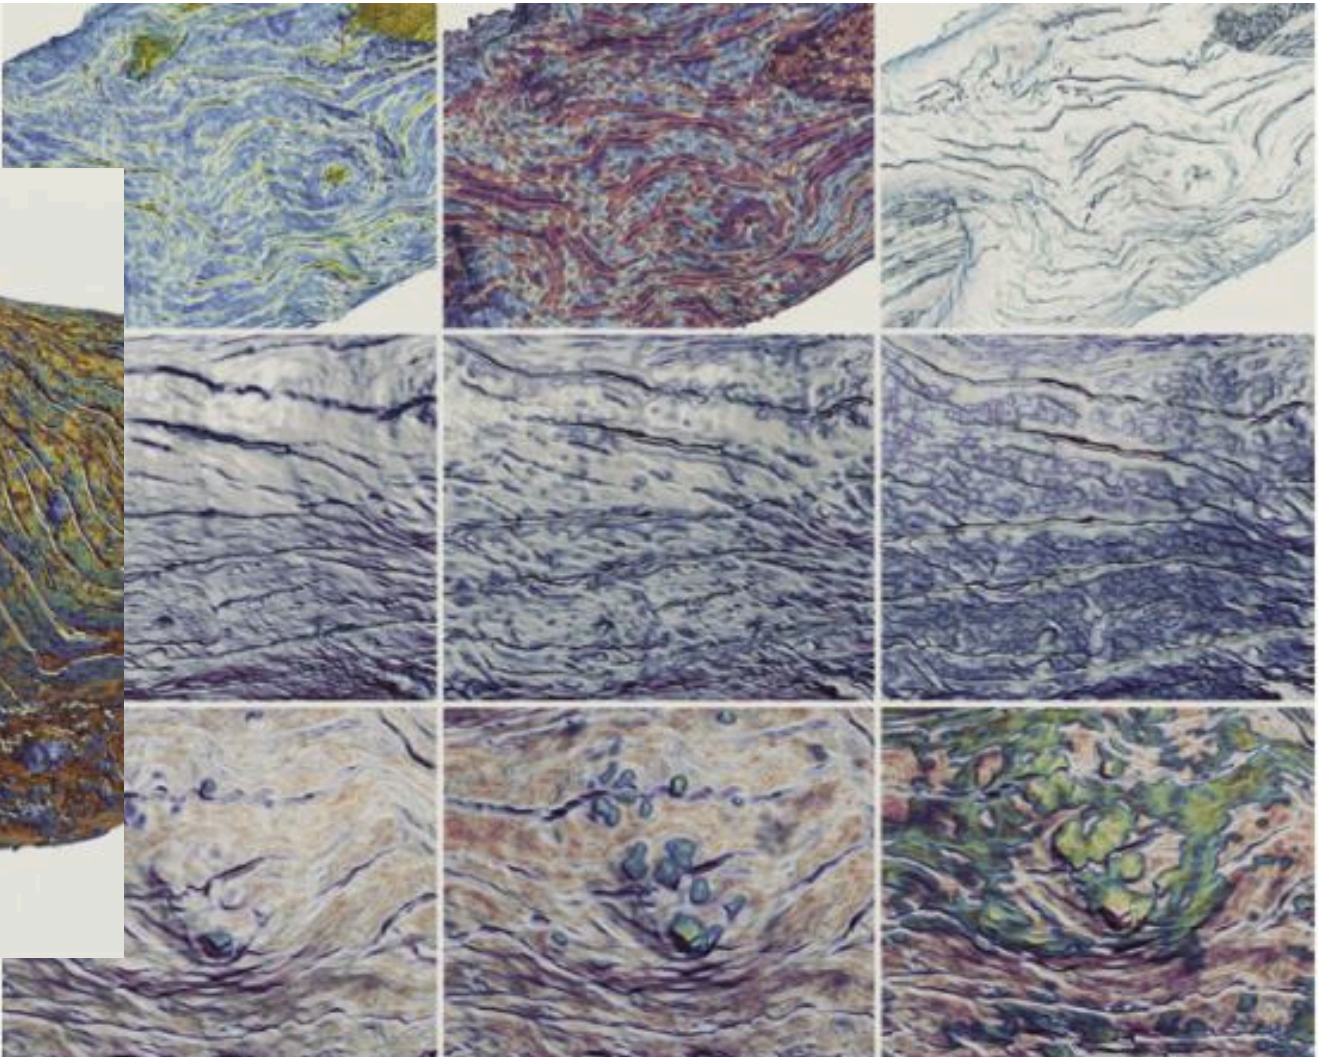

The following images present a specific case study, referenced below, that was analysed to build this data-world.

LiDAR scanning setup (top left) and 3D point cloud visualizations (black and white images).

Colour visualisation highlighting surface texture and protrusions.

Time series of colour visualisation showing cracks, surface texture and epicormic growths.

For image and caption credits see the cited papers.
